University of Arkansas – Fort Smith

July 12, 2023

## Abstract

This document presents an experiment using the Naive Bayes algorithm to predict the class of a feature vector. The algorithm assumes that the probabilities of features are independent of each other. The experiment is based on training the model on 10,000 records of credit card data, focusing on five features: Geography, isActiveMember, HasCrCard, Balance, and CreditScore. The goal is to predict the class (Exited) based on these features. The model's accuracy is then tested on 2,000 records, resulting in an accuracy of 80.50%. However, further analysis reveals that the training data heavily favors the 0 class, which explains the model's tendency to predict 0 consistently. Future work could involve manipulating the test data to observe if the model ever predicts the 1 class. Overall, the Naive Bayes algorithm shows promise in predicting the class but may require further refinement and evaluation with balanced data.

## 1 Introduction

This is my first latex document covering the Naive Bayes algorithm. The Naive Bayes algorithm makes the naive assumption that the probabilities of features are independent of each other. In this experiment I will try and predict the class of a feature vector using Naive Bayes.

## 2 Background

In Sentiment Analysis of Review Datasets using Naïve Bayes' and K-NN Classifier they tried to classify the sentiment of movie and hotel reviews. They were able to classify the sentiment of the movie review with 80% accuracy using Naive Bayes according to [? ]. Also in Sentiment analysis of Facebook statuses using Naive Bayes classifier for language learning they used a Naive Bayes classifier on Facebook statuses to classify the sentiment and got a 72% accuracy according to [? ].

## 3 Specification

In this experiment I trained my model on 10,000 records and looked at the 5 features which are Geography, isActiveMember, HasCrCard, Balance, CreditScore and then the class of Exited which is binary 1 or 0, the goal is to use the 5 features to predict the class. Then the accuracy of the model was tested on 2,000 records (83/17 train test split). The Naive Bayes Algorithm used was  $\hat{c} = \underset{j \in 1 \dots k}{\operatorname{argmax}} \frac{Pr(C_j) \prod_{i=1}^n Pr(f_i|C_j)}{\sum_k^{|C|} Pr(C_k) \prod_{i=1}^n Pr(f_i|C_k)}$  the discrete data's probability was calculated with the PMF (Probability Mass Function) and the continuous data's probability was calculated with the PDF (Probability Distribution Function) which is  $PDF(X) = \frac{1}{\sigma\sqrt{2\pi}} e^{-\frac{1}{2}(\frac{x-\mu}{\sigma})^2}$

## 4 Implementation

In my Implementation I use 5 features to try and predict the class which is a binary 0 or 1. Three of the features are discrete and two are continuous, the probabilities of the discrete features are calculated with the PMF (Probability Mass Function) and the continuous probabilities are calculated with the PDF (Probability Distribution Function). The frequencies of each feature given its class are all saved in HashMaps besides the continuous features which are all saved into an ArrayList to make it easier to calculate the PDF of them. Then using these frequencies we use the Naive Bayes Algorithm to get which class has the max probability given the feature vector.

## 5 Evaluation

I tested the model on 2,000 records and got a accuracy of 80.50% when looking further into the data 79% of the training data was classified as 0's and 21% as 1's indicating a heavy favor of the 0 class. This explains why the model guesses 0 every single time and still achieves a 80.50% accuracy.

## 6 Conclusions

Naive Bayes was able to successfully predict the class with a 80.50% accuracy. Although the training data was heavily favored in the 0's and it only predicted 0's on the test data, it would be beneficial to mess with the test data and see if it ever predicts 1.
